The Allocation of Teaching Talent and Human Capital Accumulation

Simeon Alder¹ Yulia Dudareva¹ Ananth Seshadri¹

¹University of Wisconsin-Madison

Model

Endowments, Preferences

- ▶ Each period, a measure M of agents is born and lives for two periods ("young" and "old")
- Individuals born with occupation-specific abilities drawn from a joint bivariate Fréchet distribution with c.d.f.

$$F(a^T, a^O) = \exp\left[-a_T^{-\theta} - a_O^{-\theta}\right],$$

► Individuals have log preferences over leisure and consumption (no discounting)

Model

Technologies

- Children ("young") make occupation-specific educational investments (in units of time and output)
- Adults work as teachers or production workers.
- Technologies are occupation-specific:

Human capital production (teaching) depends on teacher's h^T , child's ability a, and child's educational investments (time s and goods e) according to:

$$\boldsymbol{h}'(\boldsymbol{a}) = \left(\boldsymbol{h}^T\right)^{\beta} \boldsymbol{a}^{\alpha} \boldsymbol{s} \, (\boldsymbol{a})^{\phi} \, \boldsymbol{e}(\boldsymbol{a})^{\eta} \boldsymbol{N} (\boldsymbol{h}^T, \widetilde{\boldsymbol{H}^T})^{-\sigma}$$

Final output production depends on adult worker's human capital h^O and exogenous productivity A^O :

$$y = A^O h^O$$

Values

$$V^g(a^T, a^O, \widetilde{H}^T) = \max_{\{s^O, s^T, e^O, e^T\}} \left\{ V^{O,g}(a^O, \widetilde{H}^T), V^{T,g}(a^T, \widetilde{H}^T) \right\}$$

where

$$V^{O,g}(a^{O}, \widetilde{H}^{T}) = \ln\left(1 - s^{O}\left(a^{O}, \widetilde{H}^{T}\right)\right) + \mu \ln\left[h'^{O}A'^{O}(1 - \tau'^{O,g,w})(1 - t)\right] - e^{O}(a^{O}, \widetilde{H}^{T})(1 + \tau^{O,g,e}),$$

$$V^{T,g}(a^{T}, \widetilde{H}^{T}) = \ln\left(1 - s^{T}\left(a^{T}, \widetilde{H}^{T}\right)\right) + \mu \ln\left[\omega'(h'^{T}, \widetilde{H}'^{T})(1 - \tau'^{T,g,w})(1 - t)\right] - e^{T}(a^{T}, \widetilde{H}^{T})(1 + \tau^{T,g,e})$$

Model (cont'd)

Constraints, Laws of Motion

$$T = \int_0^\infty \omega \left(h^{T'}(a) \right) f'^T(a) da$$
$$f^T(a) = \int_0^{\bar{a}^{-1}(a)} f(a, b) db$$
$$f^O(b) = \int_0^{\bar{a}(b)} f(a, b) da$$

Aggregate laws of motion for \widetilde{H}^T and H^O :

$$\widetilde{H'}^{T} = \int_{0}^{\infty} \left(\left(\frac{2\widetilde{H}^{T}}{M} \right)^{\sigma} a^{\alpha} s^{T} \left(a, \widetilde{H}^{T} \right)^{\phi} e^{T} (a, \widetilde{H}^{T})^{\eta} \right)^{\frac{\beta}{\sigma}} f^{T}(a) da$$

$$H'^{O} = \int_{0}^{\infty} \left(\frac{2\widetilde{H}^{T}}{M} \right)^{\sigma} a^{\alpha} s^{O} \left(a, \widetilde{H}^{T} \right)^{\phi} e^{O} (a, \widetilde{H}^{T})^{\eta} f^{O}(a) da$$

Model (cont'd)

Occupational Threshold

$$a^{T*}(a^O) = \bar{a} \left(a^O, \widetilde{H}^T\right)$$

such that

$$V^O(a^O,\widetilde{H}^T) = V^T\left(a^{T*}(a^O),\widetilde{H}^T\right)$$
 , for all $a^O \in (0,\infty)$

Model (cont'd)

- Assignment of students to teachers is random
 ⇒ distribution of students' skill identical across classrooms
- lacktriangle Teachers with different h^T vary with respect to class size
- \blacktriangleright $\omega(\cdot,\cdot)$ is proportional to the *number of students* in a teacher's class and to :

$$\begin{split} \omega(h^T, \widetilde{H}^T) &= \lambda N(h^T, \widetilde{H}^T) \\ &= \underbrace{\frac{H'^O A'^O}{\frac{M}{2} \int_o^\infty f^O(a) da}}_{=N(h^T, \widetilde{H}^T)} \underbrace{\frac{\frac{M}{2} \frac{1}{\widehat{H}^T}}{\sum_{\sigma} \frac{1}{\widehat{H}^T}}}_{=N(h^T, \widetilde{H}^T)} \\ &= \underbrace{\frac{H'^O A'^O}{\int_o^\infty f^O(a) da}}_{=N(a)} \underbrace{\frac{(h^T)^{\frac{\beta}{\sigma}}}{\widehat{H}^T}}_{\widetilde{H}^T} \end{split}$$

Optimal Investments for Prospective Teachers

$$s^{T} = \frac{\mu\phi}{\mu\phi + \frac{\beta}{\sigma} - \eta}$$

$$e^{T} = \left(\frac{(1 - t)(1 - {\tau'}^{T,w})\left(\frac{2}{M}\right)^{\beta} A'^{O}(s^{T})^{\frac{\phi\beta}{\sigma}} \left(\frac{\eta\beta}{\sigma}\right) \left(\widetilde{H}^{T}\right)^{\beta} \left(a^{T}\right)^{\frac{\alpha\beta}{\sigma}}}{1 + {\tau}^{T,e}}\right)^{\frac{1}{1 - \frac{\eta\beta}{\sigma}}}$$

$$\times \left(\frac{H'^{O}}{\int_{-\infty}^{\infty} f^{O}(a) da} \left(\widetilde{H'}^{T}\right)^{-1}\right)^{\frac{1}{1 - \frac{\eta\beta}{\sigma}}}$$

Aggregate Laws of Motion

$$\begin{split} \widetilde{H'}^T &= \left[\left(\frac{(1 - {\tau'}^{T,w}) \left(\frac{\eta \beta}{\sigma} \right)}{1 + {\tau^{T,e}}} \right)^{\eta} \left(\frac{(1 - {\tau'}^{O,w}) \eta}{1 + {\tau^{O,e}}} \right)^{\frac{\eta}{1 - \eta} \eta} \left((1 - t) A'^O \right)^{\frac{\eta}{1 - \eta}} \\ &\times \left(\frac{2}{M} \right)^{\frac{\sigma}{1 - \eta}} (s^T)^{\phi} (s^O)^{\frac{\eta}{1 - \eta} \phi} \left(\frac{\int_0^{\infty} a^{\frac{\alpha}{1 - \eta}} f^O(a) da}{\int_0^{\infty} f^O(a) da} \right)^{\eta} \\ &\times \left(\int_0^{\infty} a^{\frac{\alpha \beta}{\sigma - \eta \beta}} f^T(a) da \right)^{\frac{\sigma - \eta \beta}{\beta}} \left(\widetilde{H}^T \right)^{\frac{\sigma}{1 - \eta}} \right]^{\frac{\beta}{\sigma}} \\ &H'^O &= \left(\frac{(1 - t)(1 - {\tau'}^{O,w}) A'^O \eta}{1 + {\tau^{O,e}}} \right)^{\frac{\eta}{1 - \eta}} \left(\frac{2}{M} \right)^{\frac{\sigma}{1 - \eta}} (s^O)^{\frac{\phi}{1 - \eta}} \\ &\times \left(\int_0^{\infty} a^{\frac{\alpha}{1 - \eta}} f^O(a) da \right) \left(\widetilde{H}^T \right)^{\frac{\sigma}{1 - \eta}} \end{split}$$

Optimal Investments for Prospective Teachers

$$\begin{split} s^T &= \frac{\mu\phi}{\mu\phi + \frac{\beta}{\sigma} - \eta} \\ e^T &= \left((1-t) \left(\frac{2}{M} \right)^{\sigma} A'^O \eta(s^O)^{\phi} \left(\widetilde{H}^T \right)^{\sigma} \left(a^T \right)^{\alpha} \right)^{\frac{1}{1-\eta}} \\ &\times \frac{(1-\tau'^{T,w}) (1-\tau'^{O,w})^{\frac{\eta}{1-\eta}}}{(1+\tau^{T,e}) (1+\tau^{O,e})^{\frac{\eta}{1-\eta}}} \cdot \frac{\beta}{\sigma} \\ &\times \left(\frac{\int_0^\infty a^{\frac{\alpha}{1-\eta}} f^O(a) da}{\int_0^\infty f^O(a) da} \right) \left(\int_0^\infty a^{\frac{\alpha}{\beta} - \eta} f^T(a) da \right)^{-1} \end{split}$$

Optimal Investments for Prospective "Other" Workers

$$s^{O} = \frac{\mu\phi}{\mu\phi + 1 - \eta}$$

$$e^{O} = \left(\frac{(1 - t)(1 - \tau'^{O,w})\left(\frac{2}{M}\right)^{\sigma} A'^{O}(s^{O})^{\phi} \eta\left(\widetilde{H}^{T}\right)^{\sigma} \left(a^{O}\right)^{\alpha}}{1 + \tau^{O,e}}\right)^{\frac{1}{1 - \eta}}$$

Some Parameter Restrictions

- $\blacktriangleright \ \beta < 1 \eta$ to guarantee existence of stable $\widetilde{H^T} = \widetilde{H^T}' > 0$
- $\blacktriangleright \ \frac{\sigma}{\beta} > \eta \ \mbox{and} \ \mu\phi > 0 \ \mbox{for} \ s^{T*} \in (0,1)$
- $1>\eta$ and $\mu\phi>0$ for $s^{O*}\in(0,1)$

Occupational Choice Boundary...

 \ldots does not depend on aggregate state $\widetilde{H^T}$

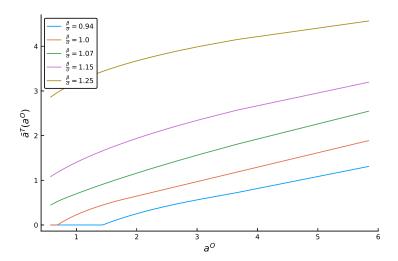

$$\left(\frac{1-\tau'^{O,w}}{1-\tau'^{T,w}}\right) \left(\frac{1-\eta}{1-\frac{\eta\beta}{\sigma}}\right) \left(\frac{1-s^O}{1-s^T}\right)^{\frac{1}{\mu}} \left(\frac{(a^O)^{\frac{\alpha}{1-\eta}}}{\left(\bar{a}^T(a^O)\right)^{\frac{\alpha}{\beta}-\eta}}\right) \\
= \left(\frac{\int_0^\infty a^{\frac{\alpha}{1-\eta}} f^O(a) da}{\int_0^\infty f^O(a) da}\right) \left(\int_0^\infty a^{\frac{\alpha}{\beta}-\eta} f^T(a) da\right)^{-1}$$

Equilibrium

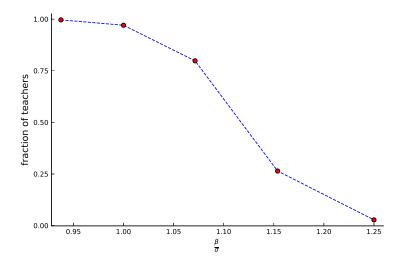

The equilibrium is characterized by:

- 1. the optimal investment for prospective teachers
- 2. the optimal investment for prospective "other" workers
- 3. the aggregate laws of motion
- 4. the occupational choice boundary and the corresponding densities f^T and f^O

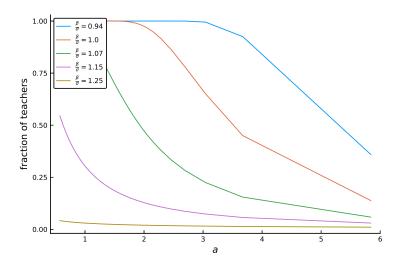

Occupational Threshold

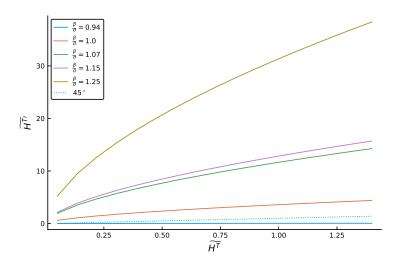

Occupational Choice (Aggregate)

Occupational Split

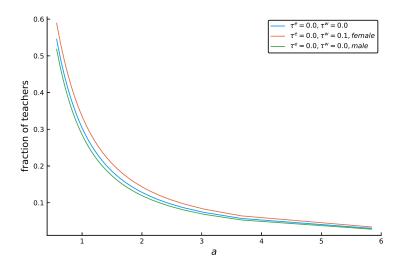

Aggregate Law of Motion for ${\cal H}^T$

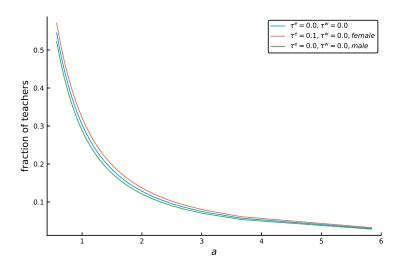

Effect of τ^w on Occupational Choice

 $\frac{\beta}{\sigma} = 1.15$

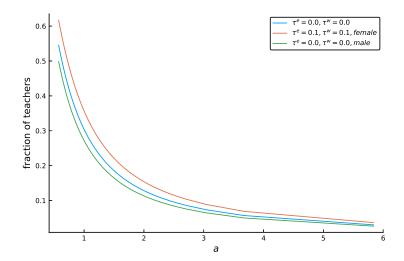

Effect of au^e on Occupational Choice

 $\frac{\beta}{\sigma} = 1.15$

Combined Effect of τ^w and τ^e on Occupational Choice

 $\frac{\beta}{\sigma} = 1.15$

Extensions

- Multiple locations:
 - finite number of locations
 - teachers' salaries funded by combination of local lump-sum (property) and proportional (sales) taxes
 - one location with T=0, all locations have $t\in(0,1)$
 - sorting of teachers and children into locations (high wage = high tax)
 - ightharpoonup sorting breaks global monotonicity between teacher's h^T and class size (still holds locally, with random within-district assignment)
 - ▶ to start with, solve with two locations ("high vs. low")
